

Case Study – Portfolio Metrics Assistant

Background

You have built a **crawl-phase prototype** that gives insight into portfolio metrics.

Now, imagine you are a Forward Deployed Engineer on Sagard's AI & Data team. Your internal "clients" are investment and portfolio operations teams who regularly consume these reports. They care about, quickly understanding how each company is performing, reducing manual work in preparing internal summaries and dashboards, and trusting the numbers they see and being able to trace them back to source documents

Objective

Prepare a **business-focused case study** that explains how your prototype could be adopted and evolved inside Sagard. You will:

- Present the problem and solution to business stakeholders
- **Demo a front-end for displaying the metrics from your crawl-phase prototype**
- Articulate a plan for how it could expand over time

We are interested in how you connect technical work to business impact, how you communicate, and how you think about evolving a proof of concept into something useful.

What to Prepare

Please prepare a **slide deck** and **one live demo** of your existing prototype. This should cover, in your own structure and words:

1. **Problem & context** - challenges with the manual process, and value of automation
 2. **Your prototype** - what it does, how it works and its main limitations
 3. **Live demo** - an walkthrough how reports are loaded, what the outputs looks like, and 1-2 examples of user insights (i.e. metrics across companies or periods)
 4. **Evolution and roadmap** - a high-level project plan to iterate and productionalize this prototype, including deliverables, timelines, dependencies and success criteria
-

What We'll Be Looking For

During the case study, we'll pay particular attention to:

- How clearly you explain the problem and your solution
- How well you tailor your language to business stakeholders
- How effectively your demo tells the story of what the prototype can do
- The realism and thoughtfulness of your proposed roadmap
- Your ability to handle questions about tradeoffs, limitations, and next steps

You do not need to have all the answers, but we'd like to see how you think about building and evolving tools that Sagard teams would actually want to use.

Deliverables

You will present your slide deck and demo in a conversation where you'll walk us through your plan but please submit a link to your deck or attach it to an email **48 hours before your interview** to allow time for review in advance.
